

## Application Example: Web

- ❑ Uses client-server communication
- ❑ Interactive (*synchronous*)
- ❑ Reliable service; uses TCP (server port 80)

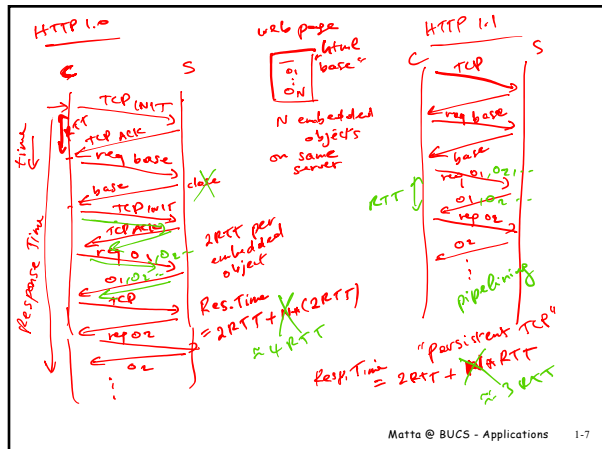

### HTTP: hypertext transfer protocol

- ❑ Web's application layer protocol
- ❑ Pull protocol
- ❑ HTTP 1.0: RFC 1945
- ❑ HTTP 1.1: RFC 2068
- ❑ HTTP 2: RFC 7540 (2015)
  - Supported by ~48% of websites (as of 9/2020)
  - HTTP 3: ~7% of websites

7

## HTTP connections

### Nonpersistent HTTP

- ❑ At most one object (html file, jpeg image, audio clip file, ...) is sent over a TCP connection
- ❑ HTTP/1.0 uses nonpersistent connections

### Persistent HTTP

- ❑ Multiple objects can be sent over single TCP connection between client and server
- ❑ HTTP/1.1 uses persistent connections in default mode

Matta @ BUCS - Applications 1-8

8

## Persistent HTTP

### Nonpersistent HTTP issues:

- ❑ requires 2 RTTs per object
- ❑ OS must work and allocate host resources for each TCP connection
- ❑ but browsers often open parallel TCP connections to fetch referenced objects

### Persistent HTTP

- ❑ server leaves connection open after sending response
- ❑ subsequent HTTP messages between same client/server are sent over connection

### Persistent without pipelining:

- ❑ client issues new request only when previous response has been received
- ❑ one RTT for each referenced object

### Persistent with pipelining:

- ❑ default in HTTP/1.1
- ❑ client sends requests as soon as it encounters a referenced object
- ❑ as little as one RTT for all the referenced objects

9

## HTTP request message

- ❑ two types of HTTP messages: *request, response*
- ❑ **HTTP request message:**
  - ASCII (human-readable format)

request line  
(GET, POST, HEAD commands)

header lines

Carriage return, line feed indicates end of header lines

```
GET /somedir/page.html HTTP/1.1
Host: www.someschool.edu
User-agent: Mozilla/4.0
Connection: close
Accept-language: fr
```

(extra carriage return, line feed)

*name of server host to support "caching"*

Matta @ BUCS - Applications 1-10

10

## HTTP request message: general format

Matta @ BUCS - Applications 1-11

11

## Uploading form input

### Post method:

- Web page often includes form input
- Input is uploaded to server in entity body

### URL method:

- Uses GET method
- Input is uploaded in URL field of request line:

www.somesite.com/animalsearch?monkeys&banana

---

---

## Method types

### HTTP/1.0

- GET
- POST
- HEAD
  - asks server to leave requested object out of response

### HTTP/1.1

- GET, POST, HEAD
- PUT
  - uploads file in entity body to path specified in URL field
- DELETE
  - deletes file specified in the URL field

## HTTP response message

status line  
(protocol  
status code  
status phrase)

header  
lines

data, e.g.,  
requested  
HTML file

```
HTTP/1.1 200 OK
Connection: close
Date: Thu, 06 Aug 1998 12:00:15 GMT
Server: Apache/1.3.0 (Unix)
Last-Modified: Mon, 22 Jun 1998
Content-Length: 6821
Content-Type: text/html
data data data data data ...
```

HTTP is "stateless" protocol

## Cookies: keeping "state"

Matta @ BUCS - Applications 1-15

15

## Web caches (proxy server)

**Goal:** satisfy client request without involving origin server

Matta @ BUCS - Applications 1-16

16

## Web caches (proxy server)

**Goal:** satisfy client request without involving origin server

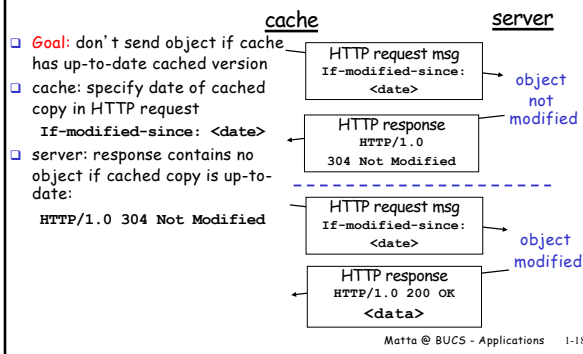

- user sets browser: Web accesses via cache
- browser sends all HTTP requests to cache
  - object in cache: cache returns object
  - else cache requests object from origin server, then returns object to client
- Reduce response time for client request
- Reduce traffic on an institution's access link
- Reduce load on origin servers

Matta @ BUCS - Applications 1-17

17

## Conditional GET

18

## Socket Interface

- Interface between application programs and TCP/IP software (introduced in Berkeley UNIX Operating System)
- Centers around *socket abstraction*
- Follows open-read-write-close paradigm
- socket (endpoint) = <IP address, port number>

Matta @ BUCS - Applications 1-19

19

## Connection-oriented (TCP) Based Application

- **Server Program**
  - Create a socket
  - Bind it to a well-known port on local machine
  - Wait for clients
- **Client Program**
  - Create a socket
  - Connect it to a server on a remote machine
  - Use it to send/receive data to/from remote machine
  - When done, close socket
